Summary

Full-stack engineer at Wednesday Solutions (Associate Forward Deployed Engineer). Own billing, checkout, and analytics for a client's AI video platform at ∼$200K MRR on React, Supabase, and Stripe. Re-architected a US EdTech client's grading platform: a Spring Boot API with 105 endpoints and a React frontend.

Education

Chandigarh College of Engineering & Technology — Chandigarh, IN

Bachelor's of Engineering in Computer Science & Engineering; CGPA: 8.31 — *Dec. 2021 – Jun. 2025*

Experience

Wednesday Solutions — Pune, IN

Associate Forward Deployed Engineer — *Feb. 2026 – Present*

AI video platform, US client | React, Supabase, Stripe, AWS Lambda, Python — *Jun. 2026 – Present*

- Own Stripe billing for the platform at ∼$200K MRR and 170+ paying customers; shipped modular plans, tiered editing credits, and annual prepay as 10 dependency-ordered PRs in 1 week of work.
- Built a sales checkout for the platform in React on 10+ edge functions: sales prices a deal and sends a proposal link, and the prospect pays through Stripe Checkout before any account exists; live 11 days after the demo.
- Built social analytics and AI coaching across 5 social networks for the client on an append-only Postgres archive with React and TanStack Query pages, and closed 32 analytics stories in 5 weeks.
- Took the platform's React and TypeScript codebase from 712 type errors to 0 across 46 PRs; CI now fails on any new error, and each PR runs only the tests its change touches, behind an 80% patch coverage gate.
- Closed a privilege escalation on the platform that let any signed-in user make themselves super-admin, locked org billing columns behind triggers, and verified each fix with SQL checks across 7 roles.

Grading platform, US EdTech client | Spring Boot, React, AWS, Terraform — *Feb. 2026 – May 2026*

- Re-architected the client's multi-tenant grading platform on Spring Boot and Java 21, with 105 REST endpoints and tenant isolation in Postgres row-level security on 20 tables that fails closed.

Projects

Flockr | *Kotlin, Jetpack Compose, Supabase* — *Nov. 2025 – Present*

- Built Flockr alone, an Android shared-home ledger in Kotlin and Jetpack Compose on Supabase, shipped over 22 releases to v2.0.0, with Postgres triggers that reject any unbalanced ledger write from any client.
- Link to project - github.com/abhisheksharm-3/flockr/releases

Inquora | *Next.js, TypeScript, Supabase, pgvector* — *Jul. 2025 – Present*

- Built Inquora alone, a cited document Q&A app on Supabase with pgvector and full-text search fused in 1 SQL function across 35 migrations, and cut a repository index from 2,664 to 711 chunks with the same coverage.
- Took Inquora from a broken deploy to live retrieval in 1 day: the send path cut from 6 roundtrips to 1, a Postgres ingest queue that retries on crash, and CI that blocks a merge on 5 checks from lint to build.

Achievements

Gen AI Exchange Hackathon by Google — October 2024

Winner — *Network18 Track*

- Led a 3-person team to the Network18 track win at Google's Gen AI Exchange Hackathon with Credify, a media attribution and forgery detection system built in 1 month on Next.js and FastAPI with Gemini.

Technical Skills

Languages: TypeScript, Python, Java, SQL, JavaScript, Go, Kotlin, C/C++
Frontend: React.js, Next.js, TanStack Query, TailwindCSS, Redux Toolkit
Backend: Spring Boot (Java), FastAPI, REST, SSE, Node.js, Express.js
AI & Agents: LangGraph, MCP, LiteLLM, Gemini, LangChain, Pinecone
Data: PostgreSQL, Supabase, Redis, MySQL, MongoDB, Neo4j
Cloud & DevOps: AWS (ECS, SQS, RDS, Lambda, Cognito, CloudFront, CloudWatch, IAM, S3, SES), Terraform, Docker, CI/CD
Platform & Tooling: Stripe Billing, k6, Sentry, Git, Event-Driven Architecture, Linux/Unix, Mixpanel
Mobile: Jetpack Compose, React Native
